Building One Airport While Running Another – May 26, 2025

PIT's transformation, which includes the addition of a new terminal, parking structure and roadway system as well as airside modernizations, has been an impressive undertaking. Even more remarkable is how PIT has continued to serve nearly 10 million passengers per year amid construction.

“Our imperatives of this airport are safety, security and public health—that’s for our passengers and employees—as well as air service,” said Paul Hoback, executive vice president and chief development officer of the ACAA. “And this project means all of those pieces are intersecting.”

Relying on insight from PIT team members from as early as the new terminal’s design phase and promoting cross-functionality between airport departments and partners has allowed PIT to operate with safety, efficiency and reliability during construction. It is that commitment to collaboration and building resiliency that has set a new standard among airports worldwide and is leading us toward the arrival of the transformed PIT this fall.
