

## Weekly Update

### Resilient Energy Design Builds Future-Proofing Into Airport's Transformation – April 28, 2025

Resiliency is purpose built into the transformed PIT, and one of the ways this is most apparent is through the addition of more efficient and advanced energy systems that work to ensure the airport's adaptability well into the future.

PIT aims to achieve LEED Gold certification on its new terminal and Parksmart certification on the new parking structure. These two globally recognized certifications grade facilities on items like efficiency, building innovation, water and energy systems and more.

This is the latest example of PIT's commitment to playing a major role in the energy space and setting up community and campus partners with efficient pathways to achieve their goals.

PIT is building facilities that can adapt in real time, operate through disruption and put people first even when things go wrong.
